

TACTILE FLUX

'Tactile Flux' highlights the diverse possibilities of EPIC Metals' corrugated decking by re-envisioning its structural and aesthetic capabilities. Pushing the boundaries of typical planar applications, Envista Taperdeck™ curves onto itself and seamlessly transitions between plinth, wall, and roof, emulating the way a glacier crevice defines and creates space. The lightweight, easily constructible form is made possible via a panelized pre-fabrication system which follows strict parametric rules, utilizing orientation and the folding of the side-laps of each panel. This allows for various permutations to be designed and laid along the riverside, thus engaging all participants along the entirety of the event space.

In our particular permutation, the surfaces of the changing room of each hut transitions into a tapered threshold that frames participants as they emerge from the river and continues to fold into a seating platform. This diversity of implied space allows for flexible usage by both plungers and spectators.
